

When you finish your homework you should be able to...

- Estimate a limit using a numerical or graphical approach.
- Learn different ways that a limit can fail to exist.
- Study and use a formal definition of limit.

Consider the function  $f(x) = \frac{x^3 - 8}{x - 2}$

Let's graph the function:

Now let's examine the limit of the function as  $x$  approaches 2 using a table. This is

written as  $\lim_{x \rightarrow 2} f(x)$ , or specifically  $\lim_{x \rightarrow 2} \frac{x^3 - 8}{x - 2}$  for our function.

$x$	1.9	1.99	1.999	2.001	2.01	2.1
$f(x)$						

## COMMON TYPES OF BEHAVIOR ASSOCIATED WITH NONEXISTENCE OF A LIMIT

1.  $f(x)$  approaches a different number from the right side of  $c$  than it approaches from the left side.
2.  $f(x)$  increases or decreases without bound as  $x$  approaches  $c$ .
3.  $f(x)$  oscillates between two fixed values as  $x$  approaches  $c$ .

Complete the table and use the result to estimate the limit.

1. 
$$\lim_{x \rightarrow -3} \frac{\sqrt{1-x} - 2}{x+3}$$

$x$	-3.1	-3.01	-3.001	-2.999	-2.99	-2.9
$f(x)$						

2. 
$$\lim_{x \rightarrow 0} \cos \frac{1}{x}$$

$x$	$\frac{1}{\pi}$	$\frac{1}{2\pi}$	$\frac{1}{3\pi}$	$\frac{1}{4\pi}$	$\frac{1}{5\pi}$	$\frac{1}{6\pi}$
$f(x)$						

3. Consider the function  $f(x) = \frac{x}{x-3}$

Let's graph the function:

$x$	2.9	2.99	2.999	3.001	3.01	3.1
$f(x)$						

What observations would you make about the behavior of this function at the asymptote?

4. Consider the function  $g(x) = \begin{cases} \sin x, & x \leq 0 \\ 1 - \cos x, & 0 \leq x \leq \pi \\ \cos x, & x > \pi \end{cases}$

Let's graph the function:

Now let's identify the values of  $c$  for which the  $\lim_{x \rightarrow c} g(x)$  exists.

## DEFINITION OF LIMIT

Let  $f$  be a function defined on an open interval containing  $c$  (except possibly at  $c$ ) and let  $L$  be a **real number**. The statement

$$\lim_{x \rightarrow c} f(x) = L$$

means that for each small positive number epsilon, denoted  $\epsilon$ , there exists a small positive number delta, denoted  $\delta$ , such that if

$$0 < |x - c| < \delta, \text{ then } |f(x) - L| < \epsilon.$$

5. Find the limit  $L$ . Then find  $\delta > 0$  such that  $|f(x) - L| < 0.01$  whenever  $|x - c| < \delta$ .

$$\lim_{x \rightarrow 5} (x^2 + 4)$$
